Marine mammals command a high level of public attention reflected in specific legislation for their protection and management in many countries. They also present particular challenges to ecologists and conservation biologists. They are mostly difficult to observe; they occupy an environment that is vast in its three-dimensional extent; there are often perceived conflicts between marine mammals and people; and furthermore, several species are now close to extinction. With 70 pages of references, this excellent book will have value for a wide range of biologists, not only those studying mammals, and will quickly take its place alongside Southwood's *Ecological Methods* as a dependable research tool.
