store CO₂ through the combined actions of ocean physics chemistry and biology This storage capacity limits the amount of human released CO₂ remaining in the atmosphere As CO₂ reacts with seawater it generates dramatic changes in carbonate chemistry including decreases in pH and carbonate ions and an increase in bicarbonate ions The consequences of this overall process known as ocean Ocean acidification or more correctly ocean carbonation as the opening chapter in this excellent book reminds us is the by now well known effect of the massive on going transfer of fossil fuel CO₂ from the atmosphere to the ocean I liked this book and will
