from the library to aid me with my research recent and comprehensive world maps of seagrass distribution are not that easy to come Seagrasses a group of about sixty species of underwater marine flowering plants grow in the shallow marine and estuary environments of all the world's continents except Antarctica The primary food of animals such as manatees dugongs green sea turtles and critical habitat for thousands of other animal and plant species seagrasses are also considered one of the most important shallow marine ecosystems for humans since they play an important role in fishery prod The World Atlas of Seagrasses will be an invaluable reference for the novice it will provide a broad background in seagrasses and for the specialist it will give insight into how local problems of seagrass distribution can be explained on a large scale
