Ecology of Seashores explores the complex shore environment. It covers the ways in which representative species have adapted to life in a constantly changing environment in terms of their interactions, the control of community structure and how energy and materials are cycled in different ecosystems. Written by an eminent marine biologist, this work emphasizes ecological processes and the use of systems analysis in understanding such processes. He gives complete This unique textbook hellip emphasizes ecological process and systems analysis. Six chapters synthesize complex systems hellip adaptations to shore life, control of community structure and energy flow and material cycling. The final chapter presents a number
